

PRO-9D SAFETY CABLE ROUTING

- When routing the safety cable for the lock release start by taking the straight end of the cable and pulling it through the hole on the cam pin on the non-power side column and then bring around the plastic pulley underneath it.

- Route the cable up and over the small plastic pulley at the top of the column, across the overhead beam and opposite plastic pulley, and then down to the power side lock handle.
- Remove the slack from the cable and tighten down the cable between the lock release handle plate and the nut.
